

# INTRODUCTION TO DATA-CENTRIC AI

---

IAP 2024

Learn how to systematically engineer  
data to build better AI systems.

<https://dcai.csail.mit.edu>

First lecture on 1/16 at 12:00p ET in Room 2-190

# For learning, data is as important as the model

In machine learning, we tend to focus on  
**the model**

When **algorithms are trained with erroneous data**

RE-

*Deep neural networks easily fit random labels.*

- Zhang et al. (ICLR, 2017)

Despite their massive size, successful deep artificial neural networks can exhibit a remarkably small difference between training and test performance. Conventional wisdom attributes small generalization error either to properties of the model family, or to the regularization techniques used during training.

Through extensive systematic experiments, we show how these traditional approaches fail to explain why large neural networks generalize well in practice. Specifically, our experiments establish that state-of-the-art convolutional networks for image classification trained with stochastic gradient methods **easily fit a random labeling of the training data**. This phenomenon is qualitatively unaffected by explicit regularization, and occurs even if we replace the true images by completely unstructured random noise. We corroborate these experimental findings with a theoretical construction showing that simple depth two neural networks already have perfect finite sample expressivity as soon as the number of parameters exceeds the number of data points as it usually does in practice.

# Traditional Machine Learning is model-centric

- When you learn ML in school... a dataset is given to you, usually fairly clean & well-curated (e.g. dog/cat images)
- Your goal: produce the best model for this dataset (model-centric AI)
  - techniques taught in standard ML classes like 6.036/6.390
- In traditional (model-centric) ML, you learn:
  - different types of models (eg. neural architectures)
  - tuning their hyperparameters
  - modifying the training loss function
  - regularization

# In many real-world ML applications, the dataset is not fixed!

- Company/user does not care what clever ML tricks you used to produce accurate predictions on highly curated data.
- Real-world data tends to be messy, so consider fixing issues in the data.
  - Ten of the most-used ML test sets have pervasive label errors.\*\* See: <https://labelerrors.com/>.
- Seasoned data scientist: It's more worthwhile to invest in exploring & fixing the data than tinkering with models. (i.e. avoid “garbage in, garbage out”)
  - But this process is cumbersome for large datasets 😞

\*\* Northcutt, Athalye, & Mueller, NeurIPS, 2021 (link to [paper](#), [code](#), errors found via [cleanlab](#))

# What is data-centric AI?

Data-centric AI often takes one of two forms:

- AI algorithms that understand data and use that information to improve models.
  - e.g. curriculum learning – train on ‘easy data’ first
    - Bengio et al., ICML, 2009 ([link to paper](#))
- AI algorithms that modify data to improve AI models.
  - e.g. confident learning – remove wrongly-labeled data prior to training
    - Northcutt et al., Journal of AI Research, 2021 ([link to paper](#))

# model-centric AI vs Data-centric AI

## Model-centric AI:

- Given a dataset, try to produce the best model (think 6.036/6.390)
- Change the model to improve performance on an AI task
  - e.g. modify the loss function, hyper-parameters, etc.

## Data-centric AI:

- Given any model, try to improve the training dataset
- **Systematically/algorithmically** change the dataset to improve performance on an AI task

# Goal: start thinking about ML in terms of data, not the model.

- Consider [KNN](#) (K Nearest Neighbors)

What is different about KNN and what we'll teach in this course?

# What is not data-centric AI?

Examples:

1. Hand-picking a bunch of data points you think will improve a model.
2. Double the size of your dataset and train an improved model on more data.

Data-centric AI versions:

1. Coreset selection
2. Dataset Augmentation

# What are examples of Data-centric AI?

- Outlier Detection and Removal (handling abnormal examples in dataset)
- Error Detection and Correction (handling incorrect values/labels in dataset)
- Data Augmentation (adding examples to data to encode prior knowledge)
- Feature Engineering and Selection (manipulating how data are represented)
- Establishing Consensus Labels (determining true label from crowdsourced annotations)
- Active Learning (selecting the most informative data to label next)
- Curriculum Learning (ordering the examples in dataset from easiest to hardest)

# Why the hype around Data-centric AI?

## Why it's time for 'data-centric artificial intelligence'

by Sara Brown | Jun 7, 2022 Source: [link](#)

≡ Forbes

Ng observes that 80% of the AI developer's time is spent on data preparation. This has been a widely shared estimate since the rise of "big data" in the late 2000s and the concomitant rise of "data scientists," known

# Why the hype around Data-centric AI?

OpenAI has 'openly' stated that one of the biggest issues with Dall-E and GPT-3 is errors in the data and labels used during training.

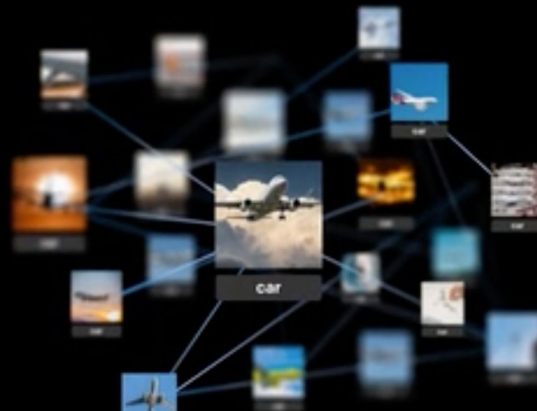

It's not the model, it's the data!

Let's take a look at the Dall-E demo page:

<https://openai.com/dall-e-2/#demos>

The technology is constantly evolving, and  
DALL-E 2 has limitations.

01:43

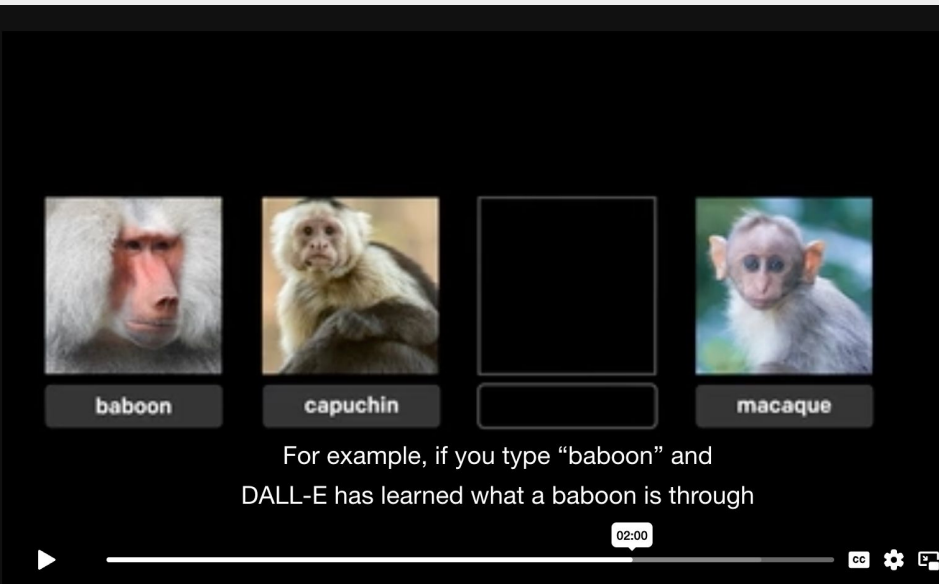

If it's taught with objects that are incorrectly  
labeled, like a plane labeled "car", and

car

a user tries to generate a car, DALL-E may  
create...a plane.

# Dall-E's big issue → label errors at training time

DALL-E 2 Explained 2:47

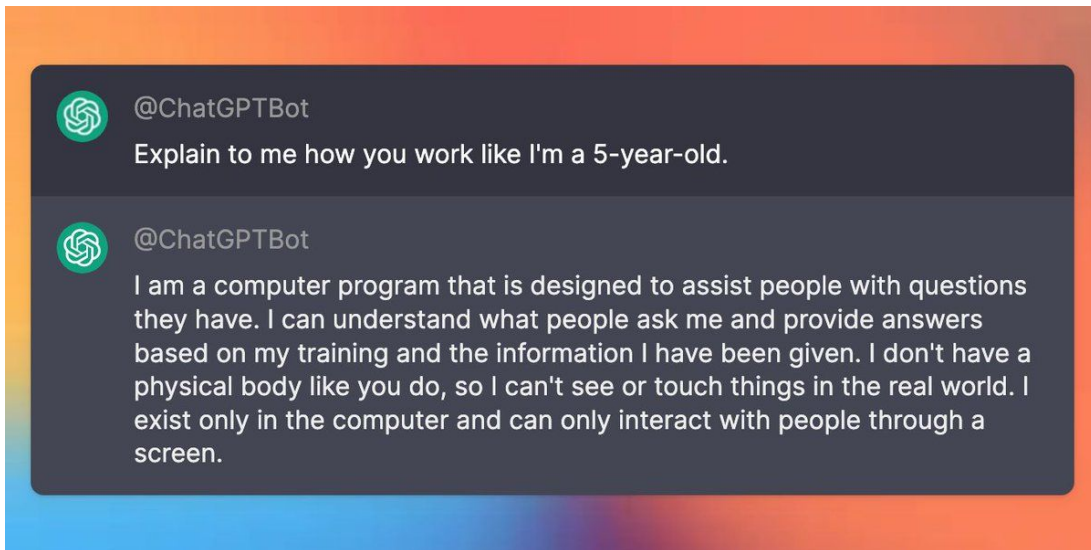

DALL-E 2 Explained 2:47

Takeaway: Reliability of ML models deployed in the real-world depends on quality of training data.

# ChatGPT improved GPT-3 by improving data quality

ChatGPT was fine-tuned to:

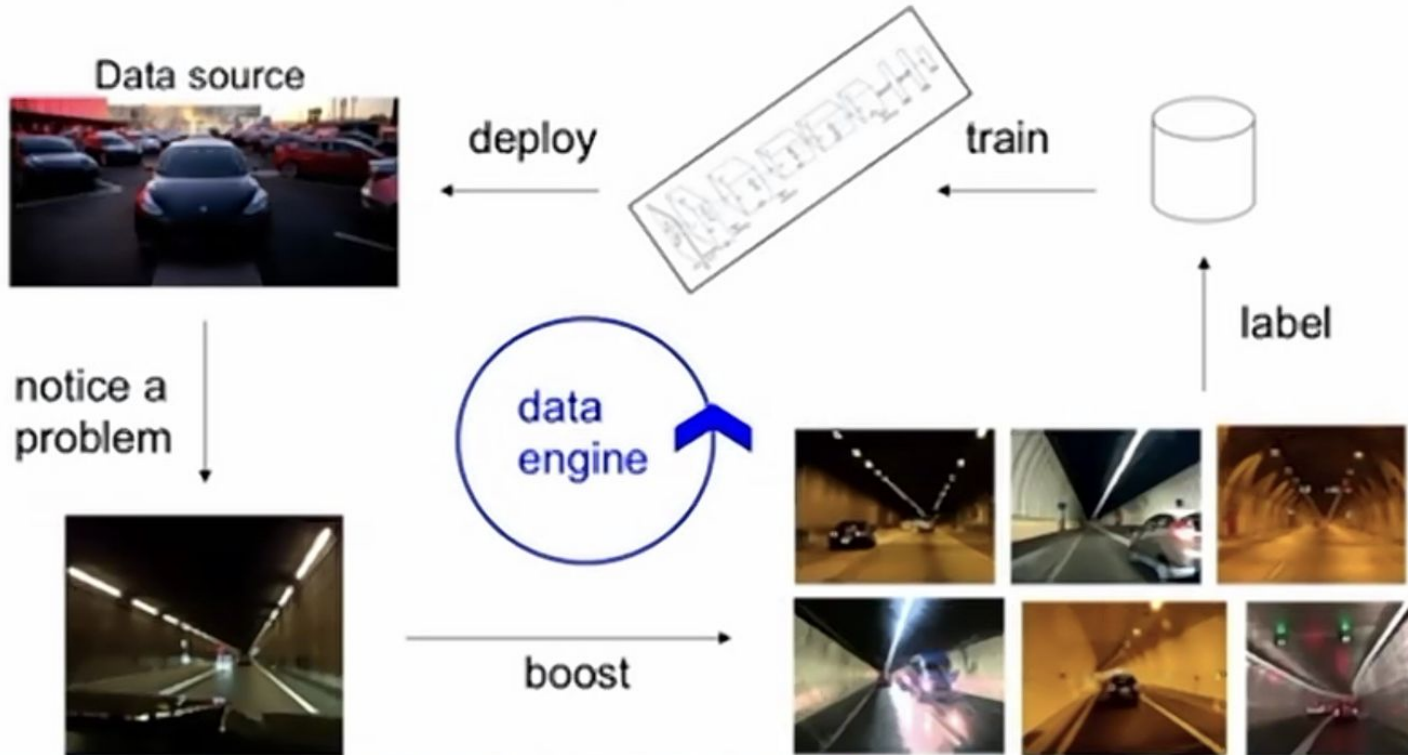

- minimize harmful, untruthful, or biased output
- Used human rankings of potential outputs to put lower-weighting on 'bad data'

# Data-centric vs model-centric for learning with noisy labels

## Compare Accuracy: Learning with 40% label noise in CIFAR-10

Northcutt et al., JAIR, 2021

“Confident Learning” ([link to paper](#))

Fraction of zeros in the off-diagonals of  $p(\tilde{y}|y^*)$

		0	0.6 ← More realistic (e.g. ImageNet)
Baseline (remove prediction $\neq$ label)	<u>Data-centric</u> Train with errors removed  <i>“Change the dataset”</i>	83.9	84.2
Confident learning methods		84.8	86.2
		86.7	86.9
		87.1	87.2
		87.1	87.2
INCV (Chen et al., 2019)		84.4	73.6
Mixup (Zhang et al., 2018)		76.1	59.8
SCE-loss (Wang et al., 2019)	<u>Model-centric</u> Train with errors  <i>“adjust the loss”</i>	76.3	58.3
MentorNet (Jiang et al., 2018)		64.4	61.5
Co-Teaching (Han et al., 2018)		62.9	58.1
S-Model (Goldberger et al., 2017)		58.6	57.5
Reed (Reed et al., 2015)		60.5	58.6
Baseline		60.2	57.3

# Before there was data-centric AI...

We relied on mostly-human-powered solutions to improve dataset quality:

- Spend more \$ for higher quality data or more labels
- Build custom tools to evaluate specific data (e.g. Tesla data quality platform)
- Fixing data inside a Jupyter notebook

Data-centric AI = systematizing these approaches to be more reliable, accurate, and generally usable on many datasets.

# PU Learning (the “perceptron” of DCAI)

Your first exposure to the magic of systematic model improvement!

# What we'll cover in this course.

## Week 1:

- **1/16 (today):** Data-Centric AI vs Model-Centric AI, **Perceptron of DCAI, PU Learning**
- **1/17:** Label Errors and Confident Learning
- **1/18:** Class Imbalance, Outliers, and Distribution Shift
- **1/19:** Advanced Confident Learning, LLM and Generative AI applications

## Week 2:

- **1/22:** Dataset Creation and Curation
- **1/23:** Data-centric Evaluation of ML Models
- **1/24:** Data Curation for LLMs
- **1/25:** Cutting-edge Research, Applications, and Advanced Topics (1)
- **1/26:** Cutting-edge Research, Applications, and Advanced Topics (2)

# The lab for today's lecture will cover

- A text classification dataset with bad html tags scraped from the internet.
- Model-centric approaches will only get you so far.
- You'll need to improve the dataset to train a better classifier.

<https://github.com/dcai-course/dcai-lab>

**Questions:** <https://piazza.com/mit/spring2024/6dcai>

# Tomorrow's lecture will cover

- Label errors and how to find them automatically.
- How to train classification models on data containing label errors.
- How test set label errors impact ML benchmarks.

# Course staff
